Resumen

Se pretende realizar despliegue y evaluación de diversas tecnologías de servidores de streaming de video sobre contenedores ligeros. Para la consecución del objetivo principal, se deberán realizar los siguientes:

- Creación de las infraestructuras paralelas distribuidas.
- Recopilación de información sobre servidores de streaming de video.
- Puesta en marcha y evaluación de prestaciones de los servidores de vídeo seleccionados.
- Generación de documentación para el despliegue de los servidores utilizados tanto en local como en la nube.

Abstract

Resúmen del PFG en inglés.

Palabras clave

video, distribuido, Kubernetes

Keywords

video, distributed, Kubernetes

Capítulo 1

Introducción

La utilización de "nuevas tecnologías"para la educación es uno de los temas centrales de las universidades y centros educativos en todo el mundo. Con la aparición de internet a finales de la década de los ToDo con la idea de compartir información de forma más rápida. La UNED ha conseguido acercar la experiencia de la formación presencial a la modalidad remota mediante la utilización de herramientas que se han ido modernizando con el paso del tiempo. Desde el uso de la radio y vídeos, pasando por televisión y más recientemente las clases online, la UNED siempre ha intentado poner a disposición de sus alumnos material audiovisual que ayudara al alumnado a la obtención de los conocimientos necesarios. Actualmente la utilización de diversas plataformas online ayudan a conseguir dicho objetivo. Una de las maneras en que se puede mejorar la calidad de la educación a distancia es mediante las clases online con streaming de vídeo. En este momento esta es una d elas herramientas utilizadas por nuestra universidad y por ello es interesante conocer herramientas que puedan ayudar ToDo

En este TFG he intentado revisar algunas tecnologías que ayuden a realizar el lema de nuestra UNED "Que la sabiduría se mueva más que las cosas que se mueven". Para ello he llevao a cabo pruebas de renidmiento sobre servidores de vídeo que puedan ayudar a realizar eficientemente streaming de vídeo y que esto se convierta en una herramienta más que ayude a la transferencia de información del profesorado al alumnado.

You are about to add the following PPA:
Ansible is a radically simple IT automation platform that makes your
 applications and systems easier to deploy. Avoid writing scripts or custom
 code to deploy and update your applications automate in a language that
 approaches plain English, using SSH, with no agents to install on remote
 systems.

http://ansible.com/

If you face any issues while installing Ansible PPA, file an issue here:

instalar dependencias de ansible

```
sudo apt-get install ansible-core
```

B.3. Creación del cluster

instalamos el master en mint00 y los ottros 3 serán slaves del mase

B.3.1. configuración de la red de los equipos:

se crea una conexión de tipo *bridge* y se le da una IP fija a cada equipo, de esta manera las VM tienen conexión a Internet y una red dedicada.

- mint00 192.168.1.100
- mint01 192.168.1.101
- mint02 192.168.1.102
- mint03 192.168.1.103

B.3.2. instalación kubectl

se descarga la última release:

```
curl -LO https://storage.googleapis.com/kubernetes-release/release/$(curl -s
  https://storage.googleapis.com/kubernetes-release/release/stable.txt)/bin/
  linux/amd64/kubectl
```

hacemos que el archivo sea ejecutable

```
chmod +x kubectl
```

movemos el binario al path del usuario para ejecutarlo directamente desde la consola.

```
sudo mv kubectl /usr/local/bin/kubectl
```

probamos que se ha instalado ejecutando el comando, comprobando que muestra su ayuda

```
tfg@mint01:~$ kubectl
kubectl controls the Kubernetes cluster manager.

Find more information at: https://kubernetes.io/docs/reference/kubectl/

Basic Commands (Beginner):
create          Create a resource from a file or from stdin
expose          Take a replication controller, service, deployment or pod and
```

```
expose it as a new Kubernetes service
run             Run a particular image on the cluster
set             Set specific features on objects

Basic Commands (Intermediate):
explain         Get documentation for a resource
get             Display one or many resources
edit            Edit a resource on the server
delete          Delete resources by file names, stdin, resources and names, or
by resources and label selector

Deploy Commands:
rollout         Manage the rollout of a resource
scale           Set a new size for a deployment, replica set, or replication
controller
autoscale       Auto-scale a deployment, replica set, stateful set, or
replication controller

Cluster Management Commands:
certificate     Modify certificate resources.
cluster-info    Display cluster information
top             Display resource (CPU/memory) usage
cordon          Mark node as unschedulable
uncordon        Mark node as schedulable
drain           Drain node in preparation for maintenance
taint           Update the taints on one or more nodes

Troubleshooting and Debugging Commands:
describe        Show details of a specific resource or group of resources
logs            Print the logs for a container in a pod
attach          Attach to a running container
exec            Execute a command in a container
port-forward    Forward one or more local ports to a pod
proxy           Run a proxy to the Kubernetes API server
cp              Copy files and directories to and from containers
auth            Inspect authorization
debug           Create debugging sessions for troubleshooting workloads and
nodes
events          List events

Advanced Commands:
diff            Diff the live version against a would-be applied version
apply           Apply a configuration to a resource by file name or stdin
patch           Update fields of a resource
replace         Replace a resource by file name or stdin
wait            Experimental: Wait for a specific condition on one or many
resources
kustomize       Build a kustomization target from a directory or URL

Settings Commands:
label           Update the labels on a resource
annotate        Update the annotations on a resource
completion      Output shell completion code for the specified shell (bash,
zsh, fish, or powershell)

Other Commands:
api-resources   Print the supported API resources on the server
api-versions    Print the supported API versions on the server, in the form of
```

```
"group/version"
config          Modify kubeconfig files
plugin          Provides utilities for interacting with plugins
version         Print the client and server version information

Usage:
kubectl [flags] [options]

Use "kubectl <command> --help" for more information about a given command.
Use "kubectl options" for a list of global command-line options (applies to all
commands).
```

podemos ejecutar los 4 comandos a la vez:

```
 curl -LO https://storage.googleapis.com/kubernetes-release/release/$(curl -s
  https://storage.googleapis.com/kubernetes-release/release/stable.txt)/bin/
  linux/amd64/kubectl &&  chmod +x ./kubectl && sudo mv ./kubectl /usr/local/
  bin/kubectl && kubectl
```

B.3.3. Instalación de docker Engine

B.3.3.1. Configuración del repositorio

actualizamos el paquete apt e instalamos certificados necesarios

```
sudo apt-get update
sudo apt-get install \
ca-certificates \
curl \
gnupg
```

Añadimos la GPG key oficial de docker

```
sudo install -m 0755 -d /etc/apt/keyrings
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo gpg --dearmor -o
   /etc/apt/keyrings/docker.gpg
sudo chmod a+r /etc/apt/keyrings/docker.gpg
```

configuramos el repositorio para descarga y configuración de docker

```
echo \
"deb [arch="$(dpkg --print-architecture)" signed-by=/etc/apt/keyrings/docker.gpg
   ] https://download.docker.com/linux/ubuntu \
"$(. /etc/os-release && echo "$VERSION_CODENAME")" stable" | \
sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

ejecutamos un update para instalar docker.

```
sudo apt-get update
```

En este punto puede ser que de un error al no existir versión de Docker para nuestra distribución de Linux.

```
sudo apt-get update

   details.
```

De darse el caso , editamos el archivo */etc/apt/sources.list.d/docker.list* con la versión de docker disponible más parecida a la que estamos ejecutando. Para ello revisamos en *https://download.docker.com/li* las distribuciones para las que docker tiene releases y elegimos la nuestra. Para saber qué distribución es la de nuestro SO, se revisa el archivo */etc/os-release* y se elige el *VERSION_CODENAME* o el *UBUNTU_CODENAME*

B.3.3.2. Instalación de Docker Engine

una vez configurado todo, instalamos Docker engine

```
sudo apt-get install docker-ce docker-ce-cli containerd.io docker-buildx-plugin
   docker-compose-plugin
```

y verificamos que está correctamente instalado ejecutando un hello world docker style.

```
sudo docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
2db29710123e: Pull complete
Digest: sha256:4e83453afed1b4fa1a3500525091dbfca6ce1e66903fd4c01ff015dbcb1ba33e
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
(amd64)
3. The Docker daemon created a new container from that image which runs the
executable that produces the output you are currently reading.
```

```
4. The Docker daemon streamed that output to the Docker client, which sent it
to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
https://hub.docker.com/
